in qumran studies the attention of scholars has largely been focused on the dead sea scrolls while archaeology has concentrated above all on the settlement this volume presents the proceedings of an international conference lugano 2014 dedicated entirely to the caves of qumran the papers deal with both archaeological and textual issues comparing the caves in the vicinity of qumran between themselves and their contents with the other finds in the dead sea region the relationships between the caves and the settlement of qumran are re examined and their connections with the regional context are investigated the original inventory of the materials excavated from the caves by roland de vaux is published for the first time in appendix to the volume

caves are dark underground hollow spaces with relatively constant temperature high humidity and limited nutrients many caves are associated with karst topography which is formed by the dissolution of soluble bedrock such as limestone dolomite and gypsum in

areas where groundwaters are undersaturated with respect to the minerals in the host rock karst landforms spread widely accounting for approximately 20% of the earth's dry ice-free surface (Ford and Williams 2007) as a typical feature of subsurface landscape karst caves develop globally with over 50,000 distributed in the United States (Barton and Jurado 2007). China also has a large contiguous karst terrain and the Yunnan-Guizhou Plateau in the southwest developed most karst caves among which the longest cave exceeds 138 km (Zhang and Zhu 2012). Many caves are relatively shallow and form near the water table in karst terranes although some caves develop by deep-seated hypogenic process at substantial depths and by process other than dissolution such as lava flows. Caves are oligotrophic ecosystems with less than 2 mg of total organic carbon per liter yet host flourishing microbial groups (Figure 1a) with an average number of 10<sup>6</sup> microbial cells per gram of cave rock (Barton and Jurado 2007). The study revealed a high diversity within bacteria domain and Proteobacteria and Actinobacteria were abundant in oligotrophic cave samples of air, rock, sediment and water. Chloroflexi, Planctomycetes, Bacteroidetes, Firmicutes, Acidobacteria, Nitrospirae, Gemmatimonadetes and Verrucomicrobia also accounted for large proportions of the total microbial community in caves (Wu et al 2015; Zhu et al 2019). In some organic cave samples such as biofilms in sulfur cave, bat guanos, spiders webs and earthworm castings, Mycobacterium was prevalently detected (Modra et al 2017; Sarbu et al 2018; Hubelova et al 2021; Pavlik et al 2021). Over 500 genera of fungi such as Penicillium, Aspergillus and Mortierella have been reported in caves (Vanderwolf et al 2013) and new fungal species were identified from cave air, rock, sediment and water samples (Zhang et al 2017, 2021). These microbial communities contain novel diversity and promote important biogeochemical processes with no sunlight microorganisms in cave environment cannot perform photosynthesis and are intensively involved in the biogeochemical cycles of carbon, nitrogen, sulfur and metals such as Fe and Mn to offset the lack of exogenous nutrients and energy.

This book discusses the karst and pseudokarst of the upper Midwest USA consisting of the states of Minnesota, Wisconsin, Iowa and Illinois. The first regional synthesis in 40 years starting with an overview of the regional geology of what is largely glaciated fluviokarst and paleokarst developed on Paleozoic carbonates but including other lithologies such as the St. Peter sandstone and the Ft. Dodge gypsum. The caves, springs, sinkholes and karst hydrogeology of each state are described. Special attention is devoted to the region's longest caves: Coldwater Cave, Mystery Cave and the Minnesota Cave Preserve. Caves application of tools such as data loggers and lidar with new conceptual models such as hypogenic speleogenesis has been transformative here. Special topics include lead and zinc mining in the Driftless Area, vertebrate and invertebrate cave fauna near the Laurentide ice limit, the impact and policies of nutrient and herbicide intensive modern agriculture on karst and paleoclimate studies, the discovery, exploration, institutional

history of caving organizations and show caves of the upper midwest from the year 1700 onwards are brought up to date the top 10 historical paradigms of cave and karst science in the midwest are reviewed perspectives on paleontology archeology and native american rock art are included
